

RF TEST REPORT

Report No.: SET2015-05327

Product Name: EFTPOS

FCC ID: VWZT1000I

Model No. : SPECTRA T1000

Applicant: SPECTRA Technologies Holdings Co., Ltd.

Applicant Address: Unit 1301-09, 19-20, Tower II, Grand Century Place, 193 Prince Edward Road West, Kowloon, Hong Kong

Issued by: CCIC-SET

Lab Location: Electronic Testing Building, Shahe Road, Xili, Nanshan District, Shenzhen, 518055, P. R. China

Tel: 86 755 26627338 **Fax:** 86 755 26627238

This test report consists of 22 pages in total. It may be duplicated completely for legal use with the approval of the applicant. It should not be reproduced except in full, without the written approval of our laboratory. The client should not use it to claim product endorsement by CCIC-SET. The test results in the report only apply to the tested sample. The test report shall be invalid without all the signatures of testing engineers, reviewer and approver. Any objections must be raised to CCIC-SET within 20 days since the date when the report is received. It will not be taken into consideration beyond this limit.

1. GENERAL INFORMATION

1.1 EUT Description

EUT Type	EFTPOS
Hardware Version	REV 10
Software Version	T1000_SystemPack_v1_9R0_pre_release
Frequency band(MHz)	13.56MHz
Frequency Range	13.553MHz – 13.567MHz
Number of channels	1
Modulation Type	ASK
Antenna Type	FPC Antenna
Antenna Gain	1dBi
Extreme Testing Voltages	Vnom=7.4V Vmin=6.3V Vmax= 8.4V
Temperature operating range	-20~55°C

1.2 Test Standards and Results

The objective of the report is to perform testing according to 47 CFR Part 15 Subpart C for the EUT FCC ID Certification:

No.	Identity	Document Title
1	47 CFR Part 15 Subpart C 2012	Radio Frequency Devices
2	ANSI C63.10 2009	American National Standard for Testing Unlicensed Wireless Devices

Test detailed items/section required by FCC rules and results are as below:

FCC Rules	Description of Test	Result
§15.203	Antenna Requirement	Compliant
§15.225(a) (b) (c)	Field Strength of Fundamental Emissions	Compliant
2.1049	20dB Spectrum Bandwidth	Compliant
§15.225(e)	Frequency Stability	Compliant
15.207	AC Power Line Conducted Emissions	Compliant
15.225(d) 15.209	Radiated Emissions	Compliant

The tests of Conducted Emission and Radiated Emission were performed according to the method of measurements prescribed in ANSI C63.10 2009.

1.3 Test Modes

Investigation has been done on all the possible configurations for searching the worst cases. The following table is a list of the test modes shown in this test report.

Test Items	
20dB Spectrum Bandwidth	Frequency Stability
AC Power Line Conducted Emissions	Field Strength of Fundamental Emissions
Radiated Emissions 9kHz~30MHz	Radiated Emissions 30MHz~1GHz
<p>NOTE:</p> <ol style="list-style-type: none"> 1. The EUT was programmed to be in continuously transmitting mode. 2. The ancillary equipment, NFC card, is used to make the EUT continuously transmit at 13.56MHz and is placed around 3cm gap to the EUT. 	

1.4 Description of the test setup

1.4.1 Conducted measurements

1.4.1.1 20dB Spectrum Bandwidth

1.4.1.2 Frequency Stability

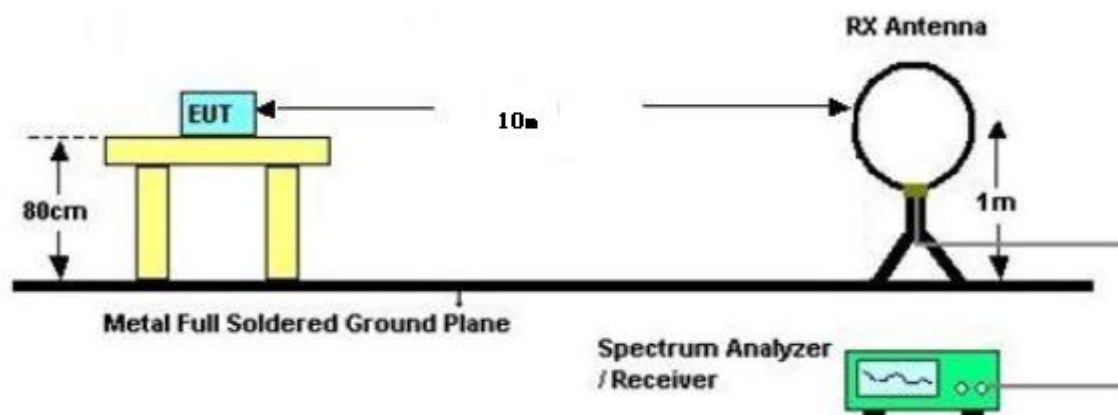

1.4.1.3 Conducted emissions

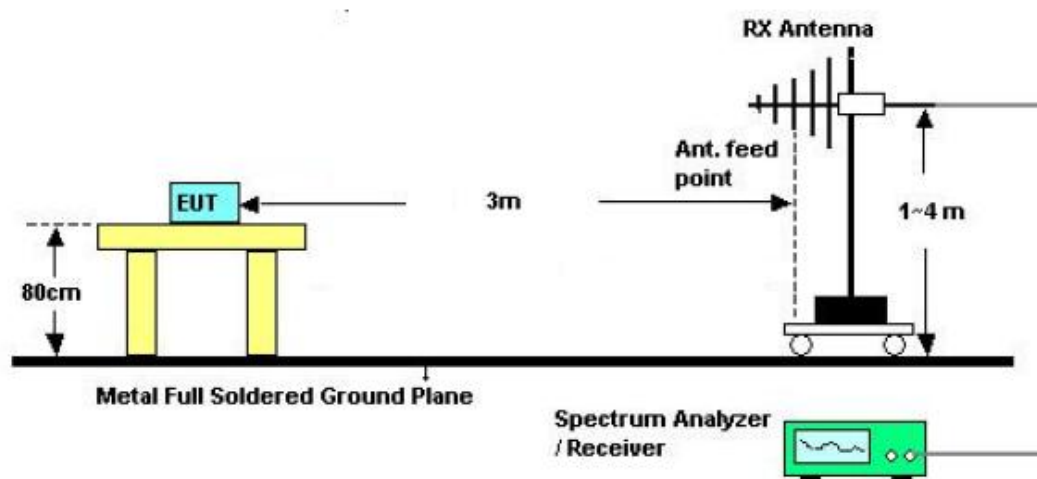

1.4.2 Radiated measurements

1.4.2.1 For radiated emissions below 30MHz

1.4.2.2 For radiated emissions above 30MHz

1.5 Facilities and Accreditations

1.5.1 Facilities

CNAS-Lab Code: L1659

CCIC Southern Electronic Product Testing (Shenzhen) Co., Ltd. CCIC is a third party testing organization accredited by China National Accreditation Service for Conformity Assessment (CNAS) according to ISO/IEC 17025. The accreditation certificate number is L1659. A 12.8*6.8*6.4 (m) fully anechoic chamber was used for the radiated spurious emissions test.

FCC-Registration No.: 406086

CCIC Southern Electronic Product Testing (Shenzhen) Co., Ltd. EMC Laboratory has been registered

and fully described in a report filed with the FCC (Federal Communications Commission). The acceptance letter from the FCC is maintained in our files. Registration 406086, valid time is until October 28, 2017.

IC-Registration No.: 11185A-1

CCIC Southern Electronic Product Testing (Shenzhen) Co., Ltd. EMC Laboratory has been registered by Certification and Engineering Bureau of Industry Canada for the performance of radiated measurements with Registration No. 11185A-1 on July. 15, 2013, valid time is until July. 15, 2016.

1.5.2 Test Environment Conditions

During the measurement, the environmental conditions were within the listed ranges:

Temperature (°C):	15 °C - 35 °C
Relative Humidity (%):	30% -60%
Atmospheric Pressure (kPa):	86KPa-106KPa

2. 47 CFR PART 15C REQUIREMENTS

2.1 Antenna requirement

2.1.1 Applicable Standard

According to FCC 15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section.

2.1.2 Antenna Information

Antenna Category:

Antenna General Information:

No.	EUT Model	Ant. Cat.	Gain(dBi)
1	SPECTRA T1000	FPC	1

2.1.3 Result: comply

The EUT has a permanently antenna. which complies with the Part 15.203. Please refer to the EUT internal photos.

2.2 20dB Spectrum Bandwidth

2.2.1 Limit

Intentional radiators must be designed to ensure that the 20dB bandwidth of the emissions in the specific band 13.553~13.567MHz

2.2.2 Test Procedures

1. The transmitter output(antenna port) was connected to the spectrum analyzer in peak max hold mode.
2. The resolution bandwidth of 1kHz and the video bandwidth of 3kHz were used.
3. Measured the spectrum width with power higher than 20dB below carrier.

2.2.3 Test result

Test conditions		20dB Spectrum Bandwidth	Test result
Tnom	Vnom	8.8kHz	PASS

2.3 Frequency Stability

2.3.1 Limit

The frequency tolerance of the carrier signal shall be maintained within $\pm 0.01\%$ of the operating frequency over a temperature variation of -20 degrees to $+50$ degrees C at normal supply voltage, and for a variation in the primary supply voltage from 85% to 115% of the rated supply voltage at a temperature of 20 degrees C. For battery operated equipment, the equipment tests shall be performed using a new battery.

2.3.2 Test Procedures

1. The transmitter transmitter output(antenna port) was connected to the spectrum analyzer.
2. EUT have transmitted signal and fixed channelize.
3. Set the spectrum analyzer span to view the entire emissions bandwidth.
4. Set RBW=1kHz, VBW=3kHz with peak detector and max hold settings.
5. The f_c is declaring of channel frequency. Then the frequency error formula is $(f_c - f)/f_c * 10^6$ ppm and the limit is less than ± 100 ppm.
6. Extreme temperature rule is $-20^\circ\text{C} \sim 50^\circ\text{C}$.

2.3.3 Test result

Test Environment		Frequency Reading (MHz)	Frequency Error	Part 15.225 Limit	Result
Adapter Power Supply	Temperature ($^\circ\text{C}$)				
DC 9V	-20	13.56019	0.0014%	$\pm 0.01\%$	Pass
	-10	13.56024	0.0018%	$\pm 0.01\%$	Pass
	0	13.56027	0.0020%	$\pm 0.01\%$	Pass
	10	13.56026	0.0019%	$\pm 0.01\%$	Pass
	20	13.56028	0.0021%	$\pm 0.01\%$	Pass
	30	13.56029	0.0021%	$\pm 0.01\%$	Pass
	40	13.56028	0.0021%	$\pm 0.01\%$	Pass
	50	13.56028	0.0021%	$\pm 0.01\%$	Pass
Max. = DC 10.35V	20	13.56029	0.0021%	$\pm 0.01\%$	Pass
Min. = DC 7.65V	20	13.56027	0.0020%	$\pm 0.01\%$	Pass

2.4 Field Strength of the fundamental Emissions

2.4.1 Limit

Rules and specifications	CFR 47 Part 15 section 15.225(a)-(d)			
Description	Compliance with the spectrum mask is tested using a spectrum analyzer with RBW set to a 9kHz for the band 13.553~13.567MHz			
Freq. of Emission (MHz)	Field Strength ($\mu\text{V/m}$) at 30m	Field Strength (dB $\mu\text{V/m}$) at 30m	Field Strength (dB $\mu\text{V/m}$) at 10m	Field Strength (dB $\mu\text{V/m}$) at 3m
1.705~13.110	30	29.5	48.58	69.5
13.110~13.410	106	40.5	59.58	80.5
13.410~13.553	334	50.5	69.58	90.5
13.553~13.567	15848	84.0	103.08	124.0
13.567~13.710	334	50.5	69.58	90.5
13.710~14.010	106	40.5	59.58	80.5
14.010~30.000	30	29.5	48.58	69.5

2.4.2 Test Procedures

1. Configure the EUT according to ANSI C63.4. The EUT was placed on the top of the turntable 0.8 meter above ground. The phase center of the loop receiving antenna mounted antenna tower was placed 3 meters far away from the turntable.
2. Power on the EUT and all the supporting units. The turntable was rotated by 360 degrees to determine the position of the highest radiation.
3. The height of the receiving antenna was fixed at one meter above ground to find the maximum emissions field strength.
4. For Fundamental emissions, use the receiver to measure QP reading.
5. When the radiated emissions limits are expressed in terms of the average value of the emissions, and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete pulse train, including blanking intervals, as long as the pulse train does not exceed 0.1 seconds. As an alternative (provided the transmitter operates for longer than 0.1 seconds) or in cases where the pulse train exceeds 0.1 seconds, the measured field strength shall be determined from the average absolute voltage during a 0.1 second interval during which the field strength is at its maximum value.

6. Compliance with the spectrum mask is tested using a spectrum analyzer with RBW set to a 9kHz for the band 13.553~13.567MHz.

Note: Emission level (dB μ V/m) = 20 log Emission level (μ V/m).

2.4.3 Test Result

Note: All NFC's spurious emissions are below 20dB of limits

2.5 Conducted Emission

2.5.1 Limit

For an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency within the band 150kHz to 30MHz shall not exceed the limits in the following table, as measured using a 50 μ H/50 Ω line impedance stabilization network (LISN).

Frequency range (MHz)	Conducted Limit (dB μ V)	
	Quai-peak	Average
0.15 - 0.50	66 to 56	56 to 46
0.50 - 5	56	46
5 - 30	60	50

NOTE:

- The lower limit shall apply at the band edges.
- The limit decreases linearly with the logarithm of the frequency in the range 0.15 - 0.50MHz.

2.5.2 Test Procedures

- The EUT was placed 0.4 meter from the conducting wall of the shielding room, and it was kept at least 80 centimeters from any other grounded conducting surface.
- Connect EUT to the power mains through a line impedance stabilization network (LISN).
- All the support units are connecting to the other LISN.
- The LISN provides 50 ohm coupling impedance for the measuring instrument.
- The FCC states that a 50 ohm, 50 microhenry LISN should be used.
- Both sides of AC line were checked for maximum conducted interference.
- The frequency range from 150 kHz to 30 MHz was searched.
- Set the test-receiver system to Peak Detect Function and specified bandwidth (IF Bandwidth = 9kHz) with Maximum Hold Mode. Then measurement is also conducted by Average Detector and Quasi-Peak Detector Function respectively.

(Plot B: N Phase)

Test Result: PASS

2.6 Radiated Emission

2.6.1 Limit

Radiated emission outside the frequency band attenuation below the general limits specified in FCC section 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in FCC section 15.205(a), must also comply with the radiated emission limits specified in FCC section 15.209(a).

According to FCC section 15.209 (a), except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Frequency (MHz)	Field Strength ($\mu\text{V/m}$)	Field Strength ($\text{dB } \mu\text{V/m}$)	Measurement Distance (m)
0.009 - 0.490	$2400/F(\text{kHz})$	$20\log(2400/F(\text{kHz}))+80$	300
0.490 - 1.705	$24000/F(\text{kHz})$	$20\log(24000/F(\text{kHz}))+40$	30
1.705 - 30.0	30	$20\log(30)+40$	30
30 - 88	100	40.0	3
88 - 216	150	43.5	3
216 - 960	200	46.0	3
Above 960	500	54.0	3

Note:

The radiated emission tests were performed in the 10-meter chamber test site, using the setup accordance with the ANSI C63.10:2009. The specification used was the FCC Part Subpart C limits.

2.6.2 Test Description

1. Configure the EUT according to ANSI C63.4. The EUT was placed on the top of the turntable 0.8 meter above ground. The phase center of the receiving antenna mounted on the top of a height-variable antenna tower was placed 3 meters far away from the turntable.
2. Power on the EUT and all the supporting units. The turntable was rotated by 360 degrees to determine the position of the highest radiation.
3. The height of the broadband receiving antenna was varied between one meter and four meters above ground to find the maximum emissions field strength of both horizontal and vertical polarization.

4. For each suspected emissions, the antenna tower was scan (from 1 M to 4 M) and then the turntable was rotated (from 0 degree to 360 degrees) to find the maximum reading.
5. Set the test-receiver system to Peak or CISPR quasi-peak Detect Function with specified bandwidth under Maximum Hold Mode.
6. When the radiated emissions limits are expressed in terms of the average value of the emissions, and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete pulse train, including blanking intervals, as long as the pulse train does not exceed 0.1 seconds. As an alternative (provided the transmitter operates for longer than 0.1 seconds) or in cases where the pulse train exceeds 0.1 seconds, the measured field strength shall be determined from the average absolute voltage during a 0.1 second interval during which the field strength is at its maximum value.
7. In case the emission is lower than 30MHz, loop antenna has to be used for measurement and the recorded data should be QP measured by receiver. Antenna Requirements

2.6.3 Test Result

For 9 kHz to 30 MHz

For 30MHz to 1000 MHz
